## **Energy Monitoring and Tracking Workshop.**

There has to be a way to reduce costs and improve the bottom line.

Set your organization on the road to energy efficiency with the Dollars to \$ense: *Energy Monitoring and Tracking Workshop*.

The last place most organizations look is at their utility costs, because they believe that they are part of the fixed overhead costs. The smart organization will look at reducing utility costs as a way to improve the bottom line. But where to begin? By developing a monitoring and tracking system.

Monitoring and tracking systems lead in helping Canadian companies and institutions save money on energy costs. Energy savings of 5-15 percent have been achieved by a diverse group of organizations in the industrial, commercial and institutional sectors that have implemented them. Once in place, the system should cost no more than 5 percent of the energy savings realized by an organization.

### **The Energy Monitoring and Tracking Workshop will show you how to:**

- gather utility information;
- find out where and how much energy is being used;
- assess your operation and determine where it should be modified;
- establish target goals for attainable energy savings;
- implement a plan of improvements; and
- formally monitor energy data.

### **Who should attend this workshop?**

- Participants in the "Spot the Energy Savings Opportunities" workshop
- Plant managers
- Building managers
- Energy consultants
- Production and plant supervisors
- Production and plant operators
- And, for your organization to get the most benefit from this workshop, an accounting representative who handles invoices for operations
